

Our Ledstierna

Our Goal

Our goal with the project is to develop a system for the MOPED project in order for it to be able to autonomously drive in a convoy, also known as platooning. Our target customer is the research institute RISE Viktoria and the VICTA lab.

Long-term Goal

The vision after the delivery of the project, is to allow for further development and experimentation by other student groups and the VICTA lab. This software is a brick in the foundation upon which autonomously driving vehicles will be built.

How

The product shall work independently from the other MOPEDs, but this does not mean that our project is an isolated island. By working with the other teams, all involved parties will benefit; we are not competing, but cooperating.

Our Values

The two cornerstones of this project are safety and innovation. The MOPED project is a step forward, and we will do our best to aid in this progress. It is a step towards a safer and greener world.
